1.0.0.zip Add-Type -AssemblyName System.Drawing \$Img2 = [System.Drawing.Image]::FromFile("c:/temp/cat.gif") \$Img1 = \$Img2.GetThumbnailImage(0,0,([System.Drawing.Bitmap]::FromImage(\$Img2)), [IntPtr] \$Img2.Dispose()) \$Img1.Save("c:/temp/cat-thumb.gif") To see the result of the above code, run this C# application: void Main() { System.Drawing.Bitmap bmp = new System.Drawing.Bitmap(@"c:/temp/cat-thumb.gif"); System.Drawing.Graphics graphics = System.Drawing.Graphics.FromImage(bmp); graphics.DrawImage(new System.Drawing.Image("c:/temp/cat.gif"), 10, 10); } Bonding of selected orthodontic brackets to acrylic resin: microtensile bond strength study. To determine the microtensile bond strengths of Transbond XT brackets to acrylic resin using two different surface treatment procedures. A total of 120 first premolar teeth were randomly assigned into four groups of 30 teeth each. Group 1 was etched with 37% phosphoric acid for 15 seconds, rinsed with water for 15 seconds, air dried, and air dried. Brackets were bonded to the etched surfaces of the teeth in Group 1 and to the etched and air-dried surfaces of the teeth in Group 2. Group 3 consisted of teeth with conventional etching technique and without bonding. Group 4 was negative control. After 24 hours of storage in distilled water, all the specimens were sectioned into 1-mm-thick slabs. Brackets were fixed to the tooth surface using a universal testing machine at a crosshead speed of 1.0 mm/minute. The debonded specimens were examined with a stereomicroscope, and failure mode was classified. The highest bond strengths were recorded for Transbond XT, air-dried etching, and Transbond XT adhesive group, whereas the lowest bond strength was 82157476af
